Conclusions

I need some **volunteers** for today

Structural Recursion

For an object-oriented CS1, structural recursion can be more natural than functional recursion.

An object is composed of a basic shape and a (recursive) instance of the same class.

- Conclusions

Beyond Graphics

Overview

Active Learning

Structural Recursion

Beyond Graphics

Python's List Class

Role Playing

Variants

Mutators

Implementation

Conclusions

Pro: Graphics are fun and tangible.

Beyond Graphics

Overview

Active Learning

Structural Recursion

Beyond Graphics

Python's List Class

Role Playing

Variants

Mutators

Implementation

Conclusions

Pro: Graphics are fun and tangible.

Con: recursive patterns are generally limited
 (“draw outer, draw rest”; “move outer, move rest”)

Beyond Graphics

Overview

Active Learning

Structural Recursion

Beyond Graphics

Python's List Class

Role Playing

Variants

Mutators

Implementation

Conclusions

Pro: Graphics are fun and tangible.

Con: recursive patterns are generally limited
 (“draw outer, draw rest”; “move outer, move rest”)

Our goal is to provide a tangible presentation for a non-graphical example of structural recursion (namely **purely-recursive lists**).

Python's List Class

Overview

Active Learning

Structural Recursion

Beyond Graphics

Python's List Class

Role Playing

Variants

Mutators

Implementation

Conclusions

Python supports a **list** class as a standard container.

Python's List Class

Overview

Active Learning

Structural Recursion

Beyond Graphics

Python's List Class

Role Playing

Variants

Mutators

Implementation

Conclusions

Python supports a **list** class as a standard container.

Disclaimer: the internal implementation is not truly recursive; its an expandible array akin to Java's ArrayList or C++'s vector.

Python's List Class

Overview

Active Learning

Structural Recursion

Beyond Graphics

Python's List Class

Role Playing

Variants

Mutators

Implementation

Conclusions

Python supports a **list** class as a standard container.

Disclaimer: the internal implementation is not truly recursive; its an expandible array akin to Java's ArrayList or C++'s vector.

Public Interface: Our students are very familiar with use of this class and its menu of behaviors (we use lists from the opening weeks of CS1).

Python's List Class

Overview

Active Learning

Structural Recursion

Beyond Graphics

Python's List Class

Role Playing

Variants

Mutators

Implementation

Conclusions

Python supports a **list** class as a standard container.

Disclaimer: the internal implementation is not truly recursive; its an expandible array akin to Java's `ArrayList` or C++'s `vector`.

Public Interface: Our students are very familiar with use of this class and its menu of behaviors (we use lists from the opening weeks of CS1).

This allows us to **decouple** two potentially intertwined concepts:

1. the use of recursion
2. the abstraction of a container class

Emulating Python's List Class

Overview

Active Learning

Structural Recursion

Beyond Graphics

Python's List Class

Role Playing

Variants

Mutators

Implementation

Conclusions

We rely on the familiar public interface by **precisely emulating** Python's list class, including behaviors such as:

count(value)	-- len -- ()
index(value)	-- contains -- (value)
append(value)	-- getitem -- (index)
insert(index, value)	-- setitem -- (index, value)
remove(value)	-- repr -- ()

This allows us to sidestep the design issue of parameterizing the recursion.

Variants

Mutators

Implementation

Conclusions

OurList Class: an instance will be represented recursively using two attributes:

- **_head**: a reference to the first element (if any)
- **_rest**: a reference to a secondary list with all remaining elements (if any)

Our base case is an **empty list**, represented with both **_head** and **_rest** set to the **None** reference.

An empty list is a natural concept for our students because Python's default list instance is empty.

This differs from `count` because the recursion does not necessarily proceed to an empty list.

The `--getitem--` method

In Python, the operator syntax `data[2]` is implemented with a call to `data.--getitem--(2)`.

Make use of other existing methods together with one recursive call.

```
def reverse(self):  
    if not self._isEmpty( ):  
        self._rest.reverse( )  
        self._rest.append(self._head)  
        self.remove(self._head)
```
