JM Predictions

Time to next failure predictions

This window calculates the U-value and Pdf for the time to next failure you propose. The dataset, prediction model and possible recalibration are set to the current selections. The time unit is that of the current dataset and the current time is taken as the last entry in the dataset.

Enter failure time:

Failure time	200
U-value	0.301874500127528
Pdf	1.25437930795737E-03

Time to next failure predictions

This window calculates the U-value and Pdf for the time to next failure you propose. The dataset, prediction model and possible recalibration are set to the current selections. The time unit is that of the current dataset and the current time is taken as the last entry in the dataset.

Enter failure time:

Failure time	2000

Database: C:\Documents and Settings\olly\Desktop\csr3.mdb Dataset: task5 Estimates: Littlewood-Verral, recalibrated

Original LV - would look at new!

Time to next failure predictions

This window calculates the U-value and Pdf for the time to next failure you propose. The dataset, prediction model and possible recalibration are set to the current selections. The time unit is that of the current dataset and the current time is taken as the last entry in the dataset.

Enter failure time:

Failure time	200
U-value	0.677013578545982
Pdf	1.31143343678043E-03

Time to next failure predictions

This window calculates the U-value and Pdf for the time to next failure you propose. The dataset, prediction model and possible recalibration are set to the current selections. The time unit is that of the current dataset and the current time is taken as the last entry in the dataset.

Enter failure time:

Failure time	2000
U-value	0.979480217452256
Pdf	1.5041005423771E-05

Time to next failure predictions

This window calculates the U-value and Pdf for the time to next failure you propose. The dataset, prediction model and possible recalibration are set to the current selections. The time unit is that of the current dataset and the current time is taken as the last entry in the dataset.

Enter failure time:

Failure time	400
U-value	0.832647478246015

CASRE (Computer Aided Software Reliability Estimation) was developed as a software reliability measurement tool that is easier for nonspecialists in software reliability engineering to use than many other currently-available tools. CASRE incorporates the mathematical modeling capabilities of the public domain tool SMERFS (Statistical Modeling and Estimation of Reliability Functions for Software), and runs in a Microsoft Windows environment.

The command interface is menu driven; enabling and disabling of menu options guides users through the selection of a set of failure data, execution of a model, and analysis of model results. Input to the models is simultaneously displayed as text and as a high-resolution display that can be controlled to let users view the data in several different ways (e.g., time between successive failures, cumulative number of failures). Model predictions and statistical evaluations of a model's applicability (e.g., prequential likelihood ratio, model bias, bias trend) may be superimposed on the plot of the data used as input to the model. CASRE also incorporates earlier findings - that prediction accuracy may be increased by combining the results of several models in a linear fashion. Users can define their own model combinations, store them as part of the tool's configuration, and execute them in the same way as any other model.

What's new in Version 3.0?
Version 3.0 includes two trend tests that may be used to determine whether it is even appropriate to apply a
